

## PROJECT BRIEF

# INTRODUCTION TO ETHEREAL

Ethereal is a platform for minting synthetic portfolio theory assets and bridges the gap between traditional finance and decentralized finance through a direct partnership with a TradFi hedge fund. Ethereum also features an on-demand full-scale algorithmically enforced option chain that allows for infinitely complex strategies to be implemented on not only significant tokens such as BTC and ETH but any token with pricing data older than 6 weeks.

You have seen synth platforms before, but what you have not seen is a platform that introduces portfolio theory assets. There is minimal need for another mirrored commodity or stock. Instead, we focus on portfolio theories and introduce asset classes that do not have a comparable - thus introducing Alpha once again into your portfolio.

Want to hedge inflation, trade first and second volume flow derivatives, hedge a portfolio against debt cycles, or long broad markets sentiments while shorting overall value expansion for a given market sector? With over 50 mintable assets, you will be able to do all of this and more with or without dynamic margin requirements. Want to create iron condors, broken wing butterflies, and diagonal spreads on BTC while also hedging your new DeFi token gamble? You will be able to do so using our on-demand option chain that uses realized volatility and synthetically created extrinsic value to establish pricing.

Ethereal is a one-stop-shop for exotic assets, derivatives, and gaining TradFi exposure in your crypto portfolio. With our semi-inflationary token ISA, you can access all products on our platform while also being able to offload your liquidity trades to our Treasury for a guaranteed return rate, which creates additional support value for the entire ecosystem.
